Scientist-led Expedition

SeaKeepers traveled to Rose Island, Bahamas in May on DISCOVERY Yacht Marcato with Dr. Austin Gallagher to conduct shark tagging. Additionally, Dr.

Brennan Phillips of the University of Rhode Island conducted deep underwater camera drops to film the ocean floor at depth of 1,300 meters.

Through The Porthole

Beluga Whale (*Delphinapterus leucas*)

The beluga whale is a bright white marine mammal that lives in the subpolar and polar waters above the Arctic Circle. They are known for their loud, clear vocalizations. Often their “singing” can be heard above the ocean surface by people in boats or onshore! Belugas feed in coastal waters during the summer and near the ice edge during the winter. Sadly, due to climate change and pollution, their polar habitats and the Arctic ecosystem, in general, are rapidly changing. Scientists have identified beluga whales as threatened near extinction.

Media Partners Spotlight

ECO Magazine: For the World's Ocean and Coastal News

ECO is a leading international marine science magazine for scientists, industry professionals and societies interested in global ocean and coastal issues. With the help of experts and thought-leaders, the magazine provides insight through a mix of in-depth articles, analytics, and news published online and in print, six times a year.
